

Activity 1: Build an Animated Notification System

Activity Type: Online / Practical

Duration: 30 Minutes

Description:

Students will create a notification system (like success, error, or warning messages). Each notification will appear with animation, include a call-to-action button, and have hover effects.

Students will use transitions, transforms, and keyframe animations to control how notifications enter and interact with the user.

Objective:

By the end of this activity, students will be able to use animations, transitions, and hover effects to create dynamic UI components. They will also understand how motion can guide user attention.

Steps

Step 1: Create the HTML Structure

- Create a container for notifications
- Add 2–3 notification boxes (success / error / warning)
- Each box includes:
 - Message text
 - Button (e.g. “Retry”, “Dismiss”)

Step 2: Basic Styling

- Add background colors for each type
- Add padding, margin, and border radius
- Align elements inside the notification

Step 3: Add Hover Effects

- On hover:
 - Slight scale using `transform: scale()`

- Change background or button color
 - Add transition for smooth effect
-

Step 4: Add Entrance Animation

- Use `@keyframes` to animate notifications
 - Example idea:
 - Start from `translateY(-20px) + opacity: 0`
 - End at normal position + `opacity: 1`
-

Step 5: Call-to-Action Highlight

- Animate the button slightly:
 - Pulse effect or color shift
 - Add hover effect on button
-

Step 6: Improve UX

- Add spacing between notifications
 - Make sure animation is smooth and not too fast
-

Activity 2: Build a Responsive Magazine Layout

Activity Type: Online / Practical

Duration: 35 Minutes

Description:

Students will design a magazine-style layout that includes a main article, side articles, and images. The layout should adapt to different screen sizes using media queries.

Students will also apply flexible images, scalable typography, and container queries to adjust content behavior.

Objective:

By the end of this activity, students will be able to create responsive layouts using media queries and container queries. They will also understand how typography and images scale across devices.

Steps

Step 1: Create Layout Structure

- Add:
 - Main article section
 - Sidebar with smaller articles
 - Images inside each section
-

Step 2: Apply Basic Styling

- Add spacing between sections
 - Style headings and paragraphs
 - Give each section a clear visual separation
-

Step 3: Flexible Images

- Make images responsive using:
 - `width: 100%`
 - `height: auto`
 - Ensure images scale correctly inside containers
-

Step 4: Scalable Typography

- Use relative units (`rem` or `em`)
 - Make headings larger than body text
 - Adjust spacing for readability
-

Step 5: Add Media Queries

- Change layout for smaller screens:
 - Stack sections vertically
 - Adjust font sizes and spacing
-

Step 6: Add Container Query

- Apply container query to article cards
 - Change layout or font size based on container width
-

Step 7: Final Polishing

- Improve spacing and alignment
- Ensure layout looks clean on different screen sizes
